

# Digital humanities: modeling semi-structured data from traditional scholarship

---

**Tom Lippincott (tom@cs.jhu.edu)**

NLP Fall 2019

Human Language Technology Center of Excellence

Center for Language and Speech Processing

# Outline

Intro: A few thoughts on “Digital humanities”

Graphs and Autoencoders

Motivating study: Post-Atlantic Slave Trade

Another application: Authorship attribution of the Hebrew bible

Ongoing work

# **Intro: A few thoughts on “Digital humanities”**

---

# What is “digital humanities”?

## Some responses:

- “an idea that will increasingly become invisible” -Stanford
- “a term of tactical convenience” -UMD
- “I don’t: I’m sick of trying to define it” -GMU
- “a convenient label, but fundamentally I don’t believe in it”  
-NYU
- “an unfortunate neologism” -Library of Congress

# What is “digital humanities”?

## Themes at DH2019

- Visualization
- Geographic information systems
- Social and ethical issues
- Education
- VR, maker spaces
- OCR
- Machine learning

# Working definitions

**Digital humanities**

**Traditional scholar**

**(Traditional) scholarly dataset**

**Computational researcher**

Traditional inquiries enabled by computational intelligence

## **Traditional scholar**

Academic from field that doesn't typically employ quantitative methods (History, Literary Criticism, . . .)

## **(Traditional) scholarly dataset**

Data assembled by a traditional researcher in the field

## **Computational researcher**

# Working definitions

## **Digital humanities**

Traditional inquiries enabled by computational intelligence

## **Traditional scholar**

Academic from field that doesn't typically employ quantitative methods (History, Literary Criticism, . . .)

## **(Traditional) scholarly dataset**

Data assembled by a traditional researcher in the field

## **Computational researcher**

Design and bring machine learning models to bear on datasets

## Why is collaboration rare?

Traditional scholars have insight into the *data*

Computational researchers can pair *data* with appropriate models

# Why is collaboration rare?

## Traditional scholars have insight into the *data*

- Data is painstakingly gathered and coveted
- Hypotheses are *subtle* but not numerically evaluated
- May publish one or two papers during PhD, but *dissertation* is primary focus

## Computational researchers can pair *data* with appropriate models

# Why is collaboration rare?

## Traditional scholars have insight into the *data*

- Data is painstakingly gathered and coveted
- Hypotheses are *subtle* but not numerically evaluated
- May publish one or two papers during PhD, but *dissertation* is primary focus

## Computational researchers can pair *data* with appropriate models

- Data is aggressively shared to encourage rigorous evaluation
- Tasks are often *shallow* and *prespecified*
- Publish multiple papers per year

## Topic models: a success story

# Topic models: a success story

## Widely used

- Low barrier to entry: everyone has “documents”
- Little expertise required to train
- Output easy to visualize and interpret

# Topic models: a success story

## Widely used

- Low barrier to entry: everyone has “documents”
- Little expertise required to train
- Output easy to visualize and interpret

## Widely abused

- Deceptively easy to use: it will always give you *something*
- You can always find “patterns”: confirmation bias abounds
- Older than some undergrads: LDA from early 2000s

## A guiding challenge:

Can we leverage sophisticated modeling techniques without losing the advantages that popularize topic models and recreating some of the same bad community practices?

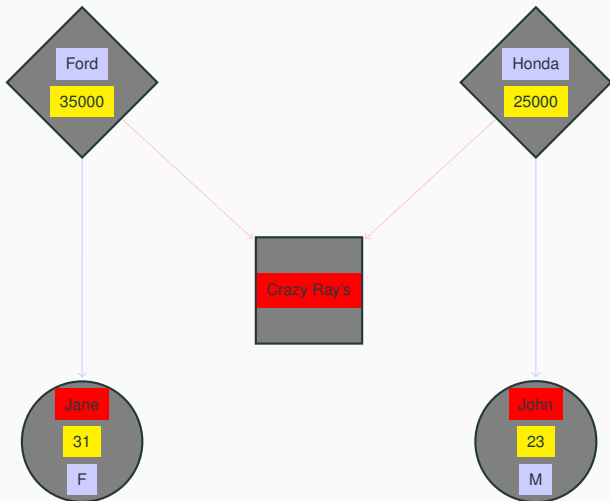

### Financial analysts, investigative reporters ...

- Concerned with specific domains
- Need to gather and understand datasets
- Construct and reason over knowledge bases
- Wide range of technical abilities
- The DH story is relevant to industry, government, etc

# Graphs and Autoencoders

---

# General relational data

## Common format: JSON

```
[  
  {"name" : "John", "age" : 23, "gender" : "M"},  
  {"name" : "Jane", "age" : 31, "gender" : "F"},  
  {"business" : "Crazy Ray's"},  
  {"make" : "Honda", "price" : 25000,  
    "owned_by" : 0, "sold_by" : 2},  
  {"make" : "Ford", "price" : 35000,  
    "owned_by" : 1, "sold_by" : 2}  
]
```

Let's design a model that naturally adapts  
to the data structure

## **Encoders, decoders, and autoencoders**

Capture the *entities* and *fields*

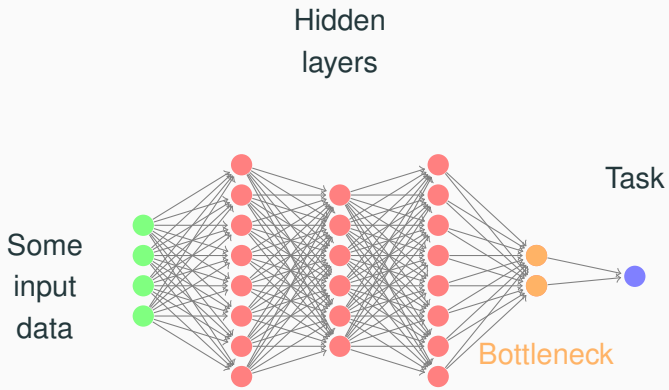

## **Graph convolutional networks**

Capture the *relationships*

# Encoder

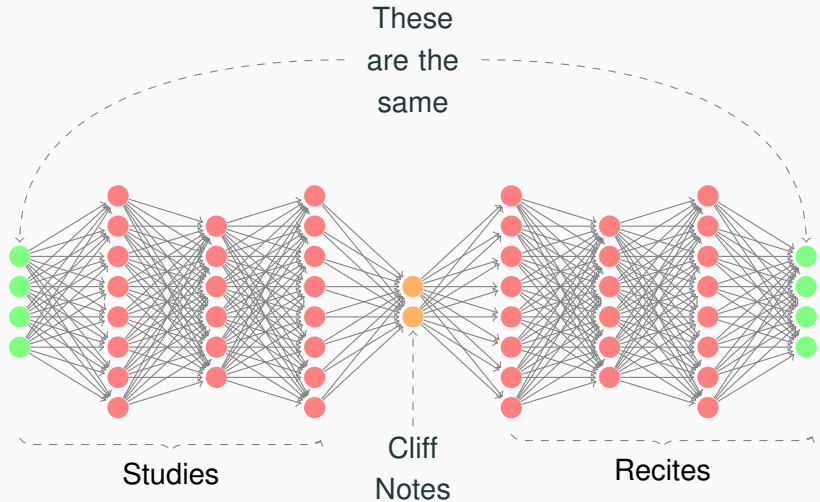

# Decoder

## Encoders and decoders are often paired

# If the goal is to reconstruct the input, it's an autoencoder

## \*coder summary

- An **encoder** transforms data into a fixed-length representation
- A **decoder** takes a fixed-length representation and generates data
- An **autoencoder** is an encoder and decoder working together to preserve data through a **bottleneck**

On to *graph convolutions*...

# Normal 1D CNN

Grid (image,  
text ...)

# Normal 1D CNN

Grid (image,  
text ...)

# Normal 1D CNN

# Normal 1D CNN

# Graph convolutional network (GCN)

Graph nodes  
(e.g. entities)

# Graph convolutional network (GCN)

# Graph convolutional network (GCN)

# Graph convolutional network (GCN)

- Extends CNNs from grids to graphs
- Information passes along edges
- Each GCN layer allows nodes to see one further “hop”

## Modeling relational data

- Encoders, decoders, autoencoders
- Graph convolutional mechanism
- **Combine these to match the data being modeled**

# Graph Entity Autoencoder (GEA)

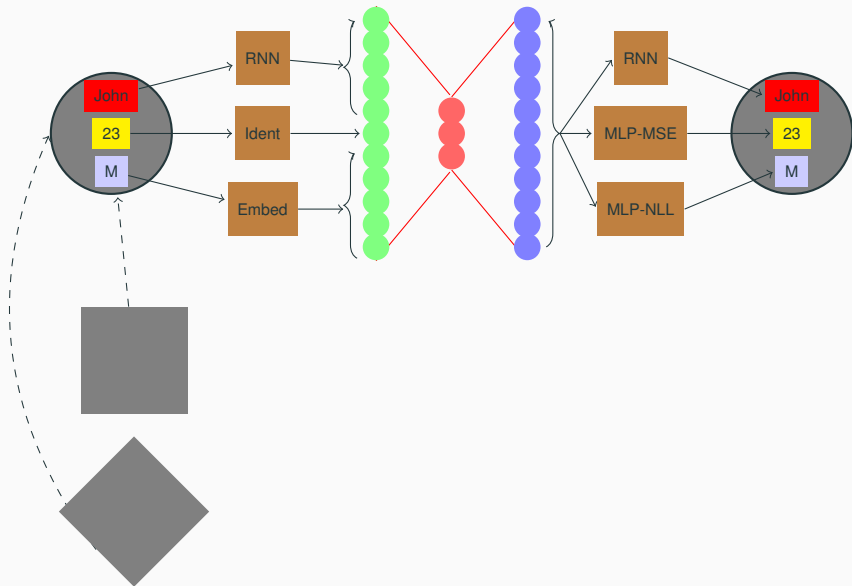

# Graph Entity Autoencoder (GEA)

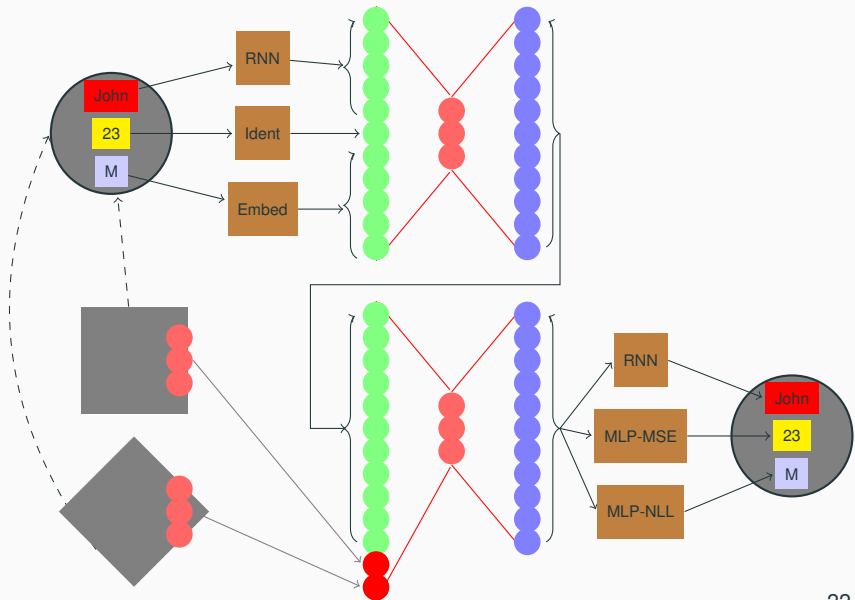

# Graph Entity Autoencoder (GEA)

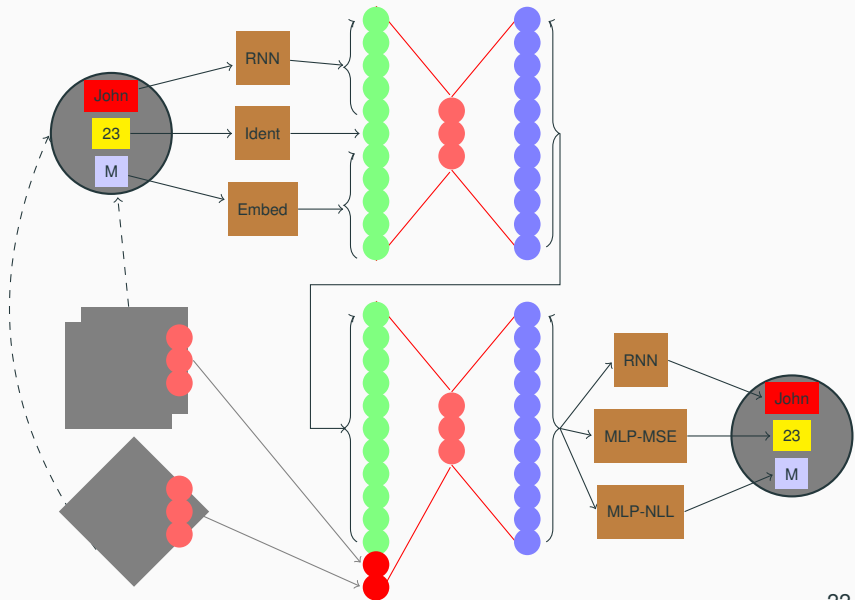

# Graph Entity Autoencoder (GEA)

# Graph Entity Autoencoder (GEA)

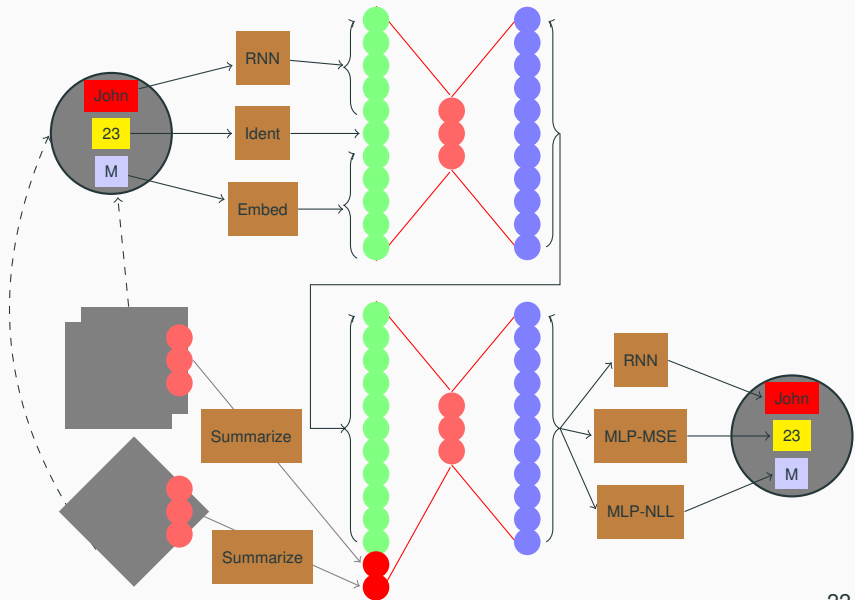

# Graph Entity Autoencoder (GEA)

# Graph Entity Autoencoder (GEA)

## How can we use a trained model?

- Compute distance between two entities
- Find flat or hierarchical clusters of entities
- Generate likely value of missing field
- Detect an improbable value of a present field
- Observe response of one field to another

## **Motivating study: Post-Atlantic Slave Trade**

# Fugitive notices

## Fugitive notices

February 21.

1770

### Three Pistoles Reward.

RAN AWAY on the 15th day of October last, a black fellow, named Davy, stout made, about five feet three inches and a quarter high; has a scar on his left cheek, which is very apparent. It is suspected that he has made towards Pennsylvania, to which state he has twice attempted to make his escape. Who ever secures the above slave in any part (if taken out of the county) so as I get him, (if taken in the county, and delivered to me) shall receive the above reward.

Raphael Bourne.

Near Port Tobacco, Feb. 21.

1770

## Some numbers

- 45k manifest entries spanning five cities
- 11k fugitive notices from 70 gazettes
- 28k unique slave names
- 7k unique owner names
- Not big data, but thousands of studies like this at a research university!

## Difficulties with data in the wild

## Difficulties with data in the wild

- Unnormalized
  - People/places/things recorded *many* times
  - “What’s the age/height/sex distribution of escapees?”

## Difficulties with data in the wild

- Unnormalized
  - People/places/things recorded *many* times
  - “What’s the age/height/sex distribution of escapees?”
- Noisy
  - Vessel type: Bark, Barke, BAque, Barque, Barques
  - Slave name: “Nelly’?”, “Nelly’s child”, “not visible”
  - Owner sex: 3k missing

## Difficulties with data in the wild

- Unnormalized
  - People/places/things recorded *many* times
  - “What’s the age/height/sex distribution of escapees?”
- Noisy
  - Vessel type: Bark, Barke, BAque, Barque, Barques
  - Slave name: “Nelly’?, Nelly’s child”, “not visible”
  - Owner sex: 3k missing
- Underspecified entities
  - *Majority* of slaves have no last name
  - Can’t tell if two “Johns” are the same person

## What might a historian want to do with this data?

- Follow one slave throughout their life
- Group owners according to the nature of their workforce
- Map out trade “ecosystems” of sellers, shippers, owners, etc
- Determine what drove valuation in transactions and rewards
- Reconstruct slave families when there are no last names

**Ask the traditional scholar to follow some simple guidelines when gathering data**

## **Another application: Authorship attribution of the Hebrew bible**

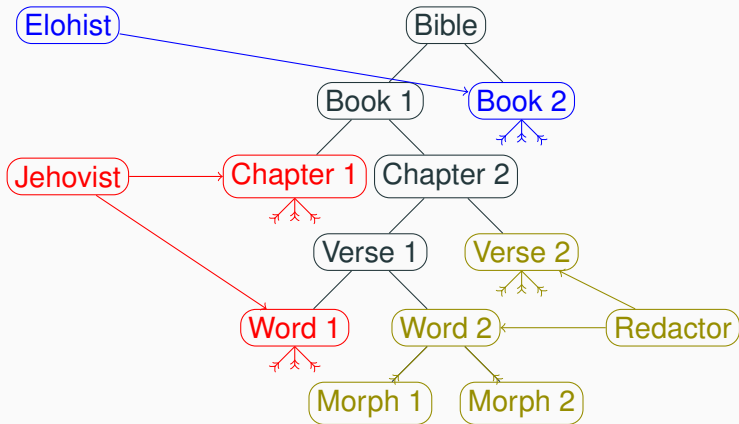

---

# Transmission of a text: the “Documentary Hypothesis”

Hebrew Bible sources timeline (Jewish Canon)

# Hypothesis as pointers into document structure

Assume the hypothesis, see how various models and features learn it as a supervised classification problem

# Thomas Mendenhall: The Characteristic Curves of Composition

## SCIENCE.—SUPPLEMENT.

FRIDAY, MARCH 11, 1887.

### THE CHARACTERISTIC CURVES OF COMPOSITION.

AGUSTUS DeMORGAN somewhere remarks (I think it is in his 'Budget of paradoxes') that some time somebody will institute a comparison among writers in regard to the average length of

mean word-length suggested itself. The new method, while scarcely more laborious than that proposed by DeMorgan, promised to yield results more quickly and of a definitely higher order. It also had the advantage of including, in its application, all that was necessary to the determination of mean word-length; so that, in reality, it furnished two distinct tests.

Preliminary trials of the method have furnished

FIG. 1.—FIRST ONE THOUSAND WORDS IN 'OLIVER TWIST'.

words used in composition, and that it may be found possible to identify the author of a book, a poem, or a play, in this way.

In reflecting upon this remark at various times within the past five or six years, always with the determination to test the value of the suggestion whenever time for the work seemed available, a more comprehensive and satisfactory method of analysis than that based simply upon

strong grounds for the belief that it may prove useful as a method of analysis leading to identification or discrimination of authorship, and it is therefore brought to the attention of the scientific and literary public in the hope that some one may be found who is at once able and willing to secure a satisfactory test of its validity.

The nature of the process is extremely simple, but it may be useful to point out its similarity to

# Mosteller and Wallace: Inference in an Authorship Problem

## The Federalist papers

- 85 articles written by Hamilton, Madison, and Jay
- 12 are unattributed
- Frequency analysis of *function words* determined Madison as author

# Back to the Documentary Hypothesis

## Problems

- The “authors” are also editors, redactors, synthesizers . . . they interact in context-dependent ways
- There is no predefined segmentation into “articles”
- We *know* more than function-words are important (e.g. name of God)

## Solutions

- Limit vocabulary to words that are used frequently by all authors
- Employ a GCN to exploit the document structure

## GEA predicts the author *slightly* better ...

Model	F-score
LR	41.39
MLP	47.45
<b>GEA</b>	<b>48.60</b>

Gold	Guess							
	J	E	P	1D	2D	nD	R	O
J	100	8	7	0	0	0	3	0
E	22	53	8	0	0	0	0	0
P	13	5	77	0	1	0	4	0
1D	2	0	2	7	1	0	0	0
2D	2	2	1	0	5	0	0	0
nD	0	0	0	1	0	0	0	0
R	3	3	11	0	0	0	33	0
O	2	0	1	0	0	0	1	0

## Sentiment and in-context word senses

- “wife” shows up as polygamous in older but monogamous in newer sources
- Redactor’s positive view of Aaron+Moses, violent story of rebellion

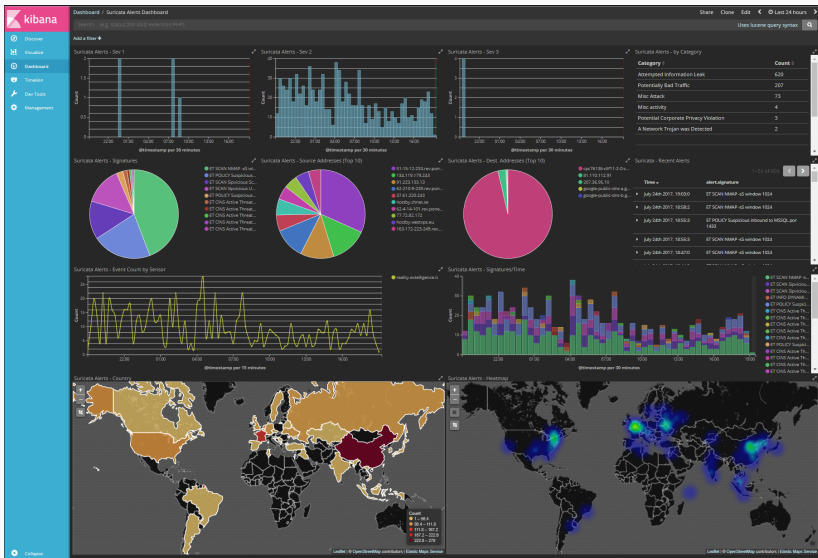

## Narrative continuity

- Abraham and Isaac story thought to *originally end with sacrifice*, changed by the Redactor
- “it was the season for grapes”  
(travel and geographic locations)  
“They broke off some grapes.”

## Ongoing work
